Therefore, it is important to understand the dynamics of droplets exhaled within the cleanroom environment and to build upon the available data that helps to advance our understanding of cleanroom risk factors. One reason for the lack of information pertaining to face mask release in terms of droplets as well as the combination of factors that influence the duration of face mask wearing in the cleanroom context is because most of the research has been in the medical field. The medical findings are of value and they can be transposed, as is undertaken in this paper, t
